

Abstract of the Disclosure

A system and method is capable of evaluating and recommending digital image print size, with a user interview for specifying an image file and a requested print size width and height, an image reader for determining the pixel dimensions of the image, an evaluator for determining acceptable viewing distance based on a predetermined limit of acceptable pixel enlargement, an evaluator for preserving image aspect ratio, and a display for showing results of the evaluation, whereby quality issues arising from users attempting too much enlargement are minimized, and delays arising from questions about enlargement size or mis-matched aspect ratios are minimized. The system and method is capable of providing for overlapped file upload to minimize print services ordering time and increase the likelihood that orders arrive at a print services provider together with the image file to be printed.
